Elixir: A Programming Language for the Current Web

ERLANG

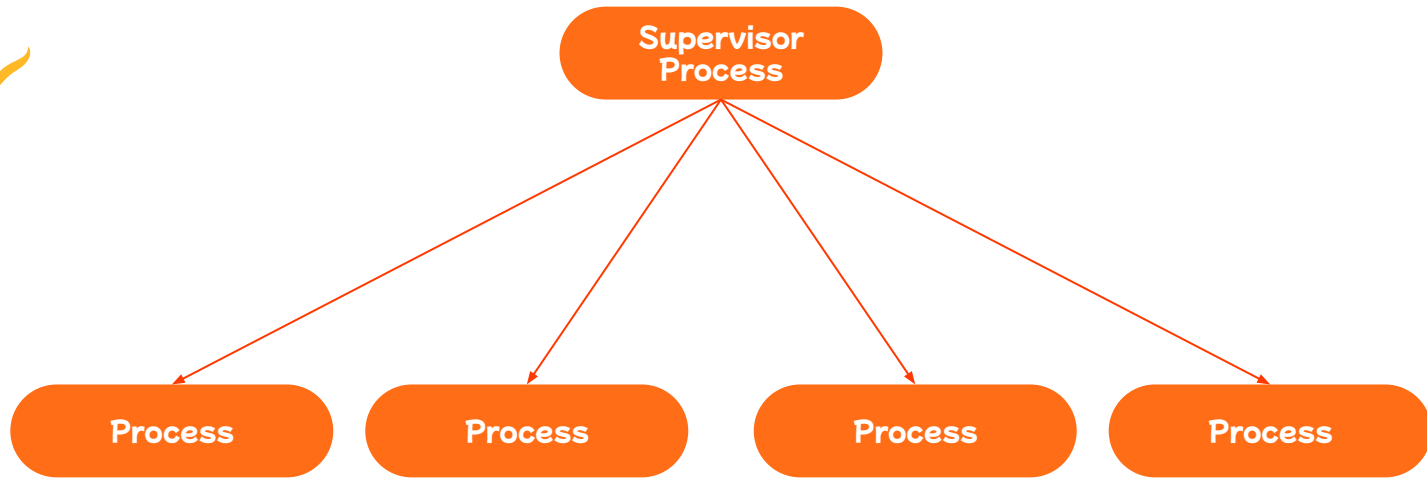

A NEW PROGRAMMING MODEL IS BORN

A NEW PROGRAMMING MODEL

LIGHTWEIGHT PROCESSES

is so great!

Then why bother with  **elixir?**

Key Features of Elixir

What is Functional Programming?

HTTP: The Heart of Web Communication

Incoming Request

The server receives a HTTP request for a given resource

Outcoming Response

The server builds the HTTP response and sends it back to the client

LiveView: Leveraging WebSockets

After first render, upgrade connection

The WebSocket allows the server to push updates to the client, and the client can also send events to the server. This enables real-time interactions without needing to refresh the page.

Key Concepts of Functional Programming

Immutability

Once a variable is declared, it cannot be changed or mutated

Function Composition

The process of using the output of one function as the input to another function

01

02

03

04

Recursion

Functions call themselves until they reach a base case

High-Order Functions

A high-order function is a function that can take other functions as arguments, or return a function as a result

Immutability

```
animals = [:bear, :elephant]
```

```
Enum.reject(animals, fn animal -> animal == :bear)  
IO.inspect(animals)  
#> [:bear, :elephant]
```

```
animals = Enum.reject(animals, fn animal -> animal == :bear)  
IO.inspect(animals)  
#> [:elephant]
```

Immutability

```
animals = [:bear, :elephant]
```

```
Enum.reject(animals, fn animal -> animal == :bear)  
IO.inspect(animals)  
#> [:bear, :elephant]
```

```
animals = Enum.reject(animals, fn animal -> animal == :bear)  
IO.inspect(animals)  
#> [:elephant]
```

Immutability

```
animals = [:bear, :elephant]
```

```
Enum.reject(animals, fn animal -> animal == :bear)  
IO.inspect(animals)  
#> [:bear, :elephant]
```

```
animals = Enum.reject(animals, fn animal -> animal == :bear)  
IO.inspect(animals)  
#> [:elephant]
```

Function Composition

```
defmodule Math do
  def add(a, b), do: a + b

  def square(x), do: x * x
end
```

Function Composition

```
defmodule Math do
  def add(a, b), do: a + b

  def square(x), do: x * x
end
```

2

```
|> Math.add(3)
```

```
|> Math.square()
```

```
#> 25
```

Recursion

```
defmodule Math do
  def factorial(0), do: 1
  def factorial(n), do: n * factorial(n - 1)
end
```

High-Order Functions

```
defmodule MyAppWeb.PageController do
  def index(conn, _params) do
    products = [
      %{name: "Product 1", price: 10, on_sale: true},
      %{name: "Product 2", price: 20, on_sale: false},
      %{name: "Product 3", price: 30, on_sale: true}
    ]

    |> Enum.filter(products, fn product -> product.on_sale end)

    render(conn, "index.html", title: "My App", items: sale_products)
  end
end
```

**LET'S GET
PRACTICAL**

Elixir is OP

Reliable
distributed
systems

IoT
Communication
Hubs

Media Pipelines
and Streaming

Machine Learning

WEB APPS

Success stories of Elixir

remote

marmela

A decorative border of stylized flames in shades of yellow, orange, and red frames the top and bottom of the image. The flames are composed of various shapes, including teardrops and pointed tongues, creating a vibrant, fiery effect.

**LEARN
MORE**

Elixir is a dynamic, functional language for building scalable and maintainable applications.

Elixir runs on the Erlang VM, known for creating low-latency, distributed, and fault-tolerant systems. These capabilities and Elixir tooling allow developers to be productive in several domains, such as web development, embedded software, machine learning, data pipelines, and multimedia processing, across a wide range of industries.

Here is a peek:

```
iex> "Elixir" |> String.graphemes() |> Enum.frequencies()
%{"E" => 1, "i" => 2, "l" => 1, "r" => 1, "x" => 1}
```

Check our [Getting Started guide](#) and our [Learning page](#) to begin your journey with Elixir. Or keep scrolling for an overview of the platform, language, and tools.
